

Network Operations Strategy Memo

To: Head of Network Operations

Date: 19 June 2026

From: Network Intelligence & Analytics Team**Re:** Five-Hub Bottleneck Diagnosis and a Targeted Plan to Cut Late Deliveries

A network-wide mapping of our delivery corridors shows that delays are not evenly spread across the system — they are concentrated. Five facilities, fewer than 1 in 300 locations we operate, are linked to roughly one-fifth of all late deliveries nationwide. Upgrading just the top three of them is projected to cut total network-wide late deliveries by 6% and recover an estimated ₹6.8 lakh in revenue currently at risk from compensation, re-delivery, and customer churn. This memo names those facilities, recommends three specific interventions, and quantifies the return on fixing them first.

1. Top 5 Bottleneck Hubs and Their Breach Contribution

These facilities sit on a disproportionate share of delivery paths — meaning a backlog at any one of them does not stay local, it radiates into every corridor connected to it. Ranked by how many of our delivery paths actually pass through each one:

Rank	Facility	Region	Shipments Routed Through	Est. Breached Shipments	% of Network Breaches
1	Gurgaon Bilaspur Hub	Haryana	1,991	~1,732	7.6%
2	Bangalore Nelamangala Hub	Karnataka	1,433	~1,218	5.3%
3	Kolkata Dankuni Hub	West Bengal	481	~471	2.1%
4	Hyderabad Shamshabad Hub	Telangana	734	~661	2.9%
5	Sonipat Kundli Hub	Haryana	574	~499	2.2%
	Total (Top 5)		5,213	~4,581	20.1%

Together, these 5 facilities are associated with roughly 1 in every 5 late deliveries across the entire network.

2. Recommended Interventions

Three corrective actions address three distinct failure patterns we found in the network:

FACILITY UPGRADE

Target: Gurgaon Bilaspur Hub (Haryana) and Kolkata Dankuni Hub (West Bengal).

Why: Gurgaon Bilaspur carries more delivery traffic than any other facility we operate, yet 87% of shipments through it are already running late. Kolkata Dankuni handles far less volume but breaches SLA on 98% of it — a near-total failure rate that points to a processing or capacity problem at the facility itself, not traffic on the roads leading to it.

Action: Add sorting and loading-dock capacity, automate manifest processing, and extend operating hours at both sites to clear backlog before it spreads downstream.

PARALLEL ROUTE

Target: The delivery centers feeding Warangal, Sivasagar, and Bilasipara.

Why: Our mapping shows these three facilities are each the only link connecting their neighboring delivery points — none of those neighbors connect directly to one another. If any one of the three goes offline for even a day, its entire surrounding area has no alternate path and shipments are stranded.

Action: Establish at least one direct, alternate corridor into each of these three neighborhoods so deliveries can be rerouted instead of stalled.

ROUTE-TYPE SHIFT

Target: Long-haul corridors past ~85 km currently served by small local-delivery vehicles, e.g. the Jairampur (Arunachal Pradesh) → Margherita (Assam) corridor, where deliveries are taking 29 times longer than expected.

Why: Small cart vehicles are cost-efficient for short, local hops but become a liability past roughly 85 km, where extra handling and relay transfers compound delay. Our route analysis flagged 24 corridors network-wide fitting this exact pattern.

Action: Move these 24 flagged long-haul corridors onto full-truckload service; keep the remaining short-haul majority on cart-based service, where it remains the cheaper option.

3. Projected Impact of Upgrading the Top 3 Hubs

Gurgaon Bilaspur, Bangalore Nelamangala, and Kolkata Dankuni together touch 3,905 shipments and are responsible for an estimated 3,422 late deliveries today — 15% of every late delivery in the network. Bringing their performance in line with a realistic post-upgrade standard yields:

6% Reduction in total network-wide late deliveries (≈1,369 fewer breached shipments)	₹6.8 Lakh Revenue-at-risk recovered, from avoided compensation, re-delivery, and service cost
---	--

In short: 3 of our 1,657 facilities — 0.2% of all locations — are the single highest-leverage investment available to this network right now.

***Methodology note:** Findings are based on network mapping and predictive analysis of historical shipment data across the operating network. Impact estimates assume facility upgrades reduce local delay rates by 40% and an average cost of ₹500 per delayed shipment (compensation, re-delivery, and service handling) — both planning assumptions that should be calibrated against actual finance and engineering data before budgeting.*
